

SSF responses

In this script we demonstrate different approaches to including covariates in an SSF model.

Create a step object

Use the `amt` package to create a trajectory object from the cleaned data.

```
buffalo_all <- buffalo_clean %>% mk_track(id = id,
                                           lon,
                                           lat,
                                           time,
```

```

all_cols = T,
crs = 4326) %>%
transform_coords(crs_to = 3112, crs_from = 4326) # Transformation to GDA94 /
# Geoscience Australia Lambert (https://epsg.io/3112)

```

Plot the data spatially

```

buffalo_all %>%
  ggplot(aes(x = x_, y = y_, colour = id)) +
  geom_point(alpha = 0.5, size = 0.1) +
  coord_fixed() +
  scale_x_continuous("Easting (m)") +
  scale_y_continuous("Northing (m)") +
  scale_colour_viridis_d() +
  theme_classic() +
  theme(legend.position = "right")

```

```

# ggsave("outputs/data_prep/buffalo_djelk_map.png",
#         width = 150, height = 150, units = "mm", dpi = 600)

```

Pick out a single individual

```
which_buffalo <- "2022" # select a single buffalo ID

buffalo_id <- buffalo_all %>% filter(id == which_buffalo)

buffalo_id %>%
  ggplot(aes(x = x_, y = y_, colour = t_)) +
  geom_point(alpha = 0.5, size = 0.1) +
  coord_fixed() +
  scale_x_continuous("Easting (m)") +
  scale_y_continuous("Northing (m)") +
  theme_classic()
```

Import spatial covariate

Although NDVI changes over time, and we have access to monthly layers, we will just select a single month here.

```
ndvi <- rast("mapping/ndvi_aug_2018.tif")
plot(ndvi, main = "NDVI August 2018")
points(buffalo_id$x_, buffalo_id$y_, col = "red", pch = 16, cex = 0.5)
```

```
ndvi
```

```

name       : ndvi
min value  : -0.5441047
max value  : 0.8086554
```

Select local extent

We just want to look at an area centred on a single location, which might be combined with our movement probability surface to generate a next-step probability surface.

We'll centre the extent on an interesting looking part of the landscape, and then buffer it by 1500m (with a buffer of the cell resolution/2 to ensure there is a central cell), which contains most of the step lengths, and therefore most of the movement kernel.

```
cell_resolution <- 25 # in metres

buffalo_single_point <- buffalo_id %>%
  filter(t_ == min(t_)) # select the first time point
```

```

buffer <- 1500 + (cell_resolution/2) # buffer in metres

window_extent <- ext(buffalo_single_point$x_ - buffer,
                     buffalo_single_point$x_ + buffer,
                     buffalo_single_point$y_ - buffer,
                     buffalo_single_point$y_ + buffer)

ndvi_window <- crop(ndvi, window_extent)

# set the extent to 0 at the buffalo location
ndvi_window <- shift(ndvi_window,
                    dx = -buffalo_single_point$x_,
                    dy = -buffalo_single_point$y_)

# plot the NDVI layer with the buffalo location as the centre point
plot(ndvi_window,
     # main = paste0("NDVI"),
     col = brewer.pal(9, "Greens"),
     plg=list(x="top", title="NDVI", tics="out", cex=.8))
points(x = 0, y = 0, col = "red")

```

```

# Save the plot
png(filename = paste0("outputs/ndvi_local_", which_buffalo, ".png"),
     width = 100, height = 100, units = "mm", res = 600)
print(plot(ndvi_window,
          # main = paste0("NDVI"),

Smooth term

Fit a GAM to the data, with a smooth term across the range of NDVI values (Klappstein et al. 2024).

Model formula

$$y \sim s(ndvi)$$

Fit model

```
# fit an ssf gam model
ssf_gam <- mgcv::gam(cbind(times, step_id_) ~
  s(ndvi, bs = "tp", k = 10) +
  # s(ndvi) +
  sl_ + log_sl + cos_ta,

Fit model

We'll fit it using the `mgcv` package, which allows us to use the `cox.ph` family for survival analysis, which is appropriate for SSF models, and we can use the `predict` function to get predictions on the log-scale.

```
