Select local extent

We just want to look at an area centred on a single location, which might be combined with our movement probability surface to generate a next-step probability surface.

We'll centre the extent on an interesting looking part of the landscape, and then buffer it by 1500m (with a buffer of the cell resolution/2 to ensure there is a central cell), which contains most of the step lengths, and therefore most of the movement kernel.

```

cell_resolution <- 25 # in metres

buffalo_single_point <- buffalo_id[7500,] # select one of the locations

buffer <- 1500 + (cell_resolution/2) # buffer in metres

window_extent <- ext(buffalo_single_point$x_ - buffer,
                     buffalo_single_point$x_ + buffer,
                     buffalo_single_point$y_ - buffer,
                     buffalo_single_point$y_ + buffer)

ndvi_window <- crop(ndvi, window_extent)

# set the extent to 0 at the buffalo location
ndvi_window <- terra::shift(ndvi_window,
                           dx = -buffalo_single_point$x_,
                           dy = -buffalo_single_point$y_)

# plot the NDVI layer with the buffalo location as the centre point
plot(ndvi_window,
     # main = paste0("NDVI"),
     col = brewer.pal(9, "Greens"),
     plg=list(x="top", title="NDVI", tics="out", cex=.8))
points(x = 0, y = 0, col = "red")

# Save the plot

Different SSF formulations

Firstly, we want to pull out the range of NDVI values to plot the curves with.

```
# histogram of NDVI values
hist(values(ndvi))
```

```
# 1% and 99% quantiles of NDVI values
ndvi_quantiles <- quantile(values(ndvi), probs = c(0.005, 0.995), na.rm = TRUE)
ndvi_quantiles
```

```
      0.5%      99.5%
0.06121541 0.71819625
```

```
# plot across the range in the local window
ndvi_values <- seq(min(0, ndvi_quantiles[1]),
                  ndvi_quantiles[2],
                  length.out = 100)

pred_data <- data.frame(ndvi = ndvi_values,
                       ndvi_sq = ndvi_values^2,
                       sl_ = 0,
                       log_sl = 0,
                       cos_ta = 0)
```

Set RSS min and max values

This is hard-coded as the maximum rss value across the different formulations, to ensure the plotting extent is consistent across approaches.

```
rss_min <- 0
rss_max <- 2.1
```
